Neurobiology of Anxiety

1st ISBS Summer School
St. Petersburg, Russia
May 9th - 15th, 2008
Depression and Anxiety

Danger

Present? Yes No

Avoidable? Yes No

Fear [meeting a tiger]
Anxiety [hearing a tiger roar]
Depression [I will not escape the tiger]
Brain emotional states

- Anxiety → Future
- Fear → Present
- Depression → Past
- PTSD → Past
Clinical Anxiety Disorders
Subtypes of anxiety

- **Panic disorders** with or without agoraphobia
- **Phobias**, including specific phobias and social phobia
- **OCD**: unwanted, intrusive, persistent thoughts or repetitive behaviors. Affects between 2-3% of the population
- **Stress disorders**: post-traumatic stress disorder (PTSD) and acute stress disorder
- **Generalized anxiety disorder (GAD)**. The most commonly diagnosed anxiety disorder, occurs most frequently in young adults
- **Anxiety disorders due to known physical causes** (medical conditions or substance abuse)
- **Anxiety disorder not otherwise specified**: ???
Diagnosis

To better differentiate between GAD and other anxiety or depressive disorders, 4 “first rank” and at least 1 “second rank” symptoms are needed.

First
- Inability to relax, restlessness
- Fatigueability
- Exaggerated startle response
- Muscle tension
- Sleep disturbances
- Difficulty in concentrating
- Irritability

Second
- Nausea or abdominal complaints
- Dry mouth
- Tachycardia
- Tremor
Statistics of anxiety disorders

• The most common mental illness in the US

• 40 million (18%) of the adult US population affected

• Cost $ 42 billion a year

• People with anxiety are 6 times more likely to be hospitalized for psychiatric disorders than non-sufferers

• Commonly co-occur with other mental or physical illnesses, including alcohol or substance abuse

• The lifetime prevalence of Anxiety Disorders is 25%
thought anxiety was a product of unresolved psychosexual tension that had not been released

Later distinguished two types of anxiety:

1) Traumatic – arising from the person being overwhelmed by stressors

2) Neurotic – anticipation of negative consequences that activates defensive processes
Anxiety: state vs. trait

Formulated the State–Trait Anxiety Inventory (STAI) that has been translated and adapted in 66 languages and dialects.

State anxiety reflects a "transitory emotional state or condition of the human organism that is characterized by subjective, consciously perceived feelings of tension and apprehension, and heightened autonomic nervous system activity."

Trait anxiety refers to "relatively stable individual differences in anxiety proneness . . ."
Persons of note with anxiety

- Anthony Hopkins (actor)
- Barbra Streisand (singer)
- Abraham Lincoln (president)
- David Bowie (singer)
- Edvard Munch (artist)
- Eric Clapton (musician)
- Johnny Depp (actor)
- Nicholas Cage (actor)
- Nicole Kidman (actress)
- Oprah Winfrey (host)
- Sigmund Freud (psychiatrist)
- Sir Isaac Newton (scientist)
Genetics of anxiety

Temperament and personality

Genetic factors

Stress

Anxiety-related traits

Resistance

Panic Disorder

Mood Disorder

Generalized Anxiety Disorder

OCD
Anxiety is genetically determined

- Twin studies: 40-60% of variance in anxiety levels is due to genetic factors
- Twin and adopted sibling studies: both genetic and environmental factors play a role in susceptibility to anxiety
- Hints from evolutionary psychology: Possible adaptive significance of anxiety in some populations to prevent becoming socially isolated from the larger group
Circuits

- Anxiety = stress + center + periphery

- **Limbic system** overactivity can increase arousal and awareness of the environment, leading to symptoms of anxiety (Gray, 1983).

- **Hypothalamic-pituitary-adrenal (HPA) axis**: amygdala and BNST mediate anxiogenic behavior and HPA activation (Green et al., 2003)

- **The serotonergic system**: serotonergic drugs increase mouse anxiety in one tests and reduce in another tests: “stress trigger”? (Graeff et al., 1997).
Pathophysiology: Cytokines

- Exposure to stress (e.g., surgery) up-regulates pro-inflammatory cytokines, which are also involved in mood and memory disturbances (Shapira-Lichter et al., 2007)

- Preoperative anxiety, during the waiting weeks before cardiac surgery increase plasma levels of IL-6 (Ai et al, 2005)
Anxiety-vestibular system

Eye, head movement & postural changes

- Vestibular cortex
- Vestibular nuclei
- “Vestibular” cortex

- Orbifrontal Cortex
  - Infrolimbic and Insular Cortex
  - Central Amygdaloid Nucleus
  - Parabrachial Nuclei

- Nucleus Tractus Solitarii

- Hypothalamus
- Hypothalamic Responses

- Bed Nucleus of Stria Terminalis

- Autonomic Responses

- Endocrine Responses
Mediators and hormones

Adrenaline
- Exaggerated responsiveness of presynaptic alpha$_2$ autoreceptors (Koob, 1999)

Serotonin
- Both excesses and deficiencies in serotonin can create anxiety

Corticosteroids
- Corticosteroids are unbalanced due to chronic stress
GABA pathways in normal brain
GABAergic system
GABA_A receptor
The role of GABA

GABAergic system: works with Glutamate to modulate neuronal excitability and CNS arousal

- Imaging studies on patients with panic disorder revealed reduced benzodiazepine binding (Kaschka et al., 1995)
- Anxious patients have downregulated GABA system in frontal cortex (Goddard et al., 2001)
- Negative correlations found between baseline cerebrospinal fluid GABA and anxiety and panic attack frequency (Goddard et al., 1996)
GABAergic-glutamatergic balance

- Normal physiologic range
- Abnormal hypoexcitability
- Abnormal hyperexcitability
Potential routes to anxiety

- Challenge
  - Brain anxiety circuits
    - Peripheral symptoms
      - Cognitions
  - Anxiety
      - Cognitions
Treatments

Pharmaceuticals

- SSRIs
- Benzodiazepines

Herbal

- Relaxant made from the root of Kava plant
Other therapies

Cognitive behavioral therapy
- Relaxation training to alleviate somatic symptoms
- Re-shaping cognitive skills and positive psychology
- Exposure and response prevention to worry behaviors
- Imagery and habituation to feared situations
- Self monitoring and early problem-detection
- is significantly more effective than no treatment
- Shows 40-60% improvement rates (Durham et al., 1999)

Placebo
Comorbidity: anxiety and depression

- Comorbidity of anxiety and depression: up to 60-70%

- Anxiety and depression have common genetic origins (Kendler et al., 1992, 1996)

- Patients with both disorders show more impairmen than those with only one

- Comorbidity lowers chances of remission from either depression or anxiety (Sherbourne and Wells, 1997).

Bruce et al., 2001

% of patients with GAD & MDD

0% Prior to GAD | 50% Same year | 100%
Comorbidity with other disorders

• Eating disorders
• Irritable bowel syndrome
• Substance abuse
• Asthma (with comorbid anxiety and depressive disorders)
• Tourette’s syndrome
• Compulsive behaviors
• Schizophrenia
• Autism
• Epilepsy
• Cognitive/memory deficits
• Neurodegenerative disorders
Comorbidity with other disorders

Kalueff et al., 2007
Sex differences in anxiety and depression

- Adolescent females are significantly more likely to experience low to moderate levels of depression and anxiety than adolescent males.
- Some factors stem from reproductive differences, such as post-partum depression or menopausal alterations in mood/hormones.
- Women are 2-3 times more likely to develop PTSD after a traumatic episode than men.
- Women are twice more likely to be diagnosed with depression.
- Generalized Anxiety Disorder (GAD) and PTSD occur twice as frequently in women as in men.

Afifi, 2000; Halbreich and Kahn, 2007
Obsessive-compulsive disorders

- A common, debilitating brain disorder
- Currently under “Anxiety spectrum disorders”
- Has many specific peculiarities (a separate nosological entity?)

Famous people with OCD:
- Howard Hughes
- Martin Scorsese
- Stanley Kubrick
- Harrison Ford
- Paul Gascoigne
- Nikola Tesla
- Donald Trump
- Ludwig van Beethoven
- Albert Einstein
- Leonardo DiCaprio
- Michael Jackson

OCD

**Compulsions**
- Contamination
- Pathological doubt
- Somatic
- Need for symmetry
- Aggressive impulse
- Sexual impulse
- Other
- Multiple obsessions

**Obsessions**
- Checking
- Washing
- Counting
- Need to ask or confess
- Symmetry/precision
- Hoarding
- Multiple compulsions
“And that one's for the relief of anxiety caused by the high cost of medication.”
